Dynamic Pages Documentation

URL to live web application: http://malenah-portal.appspot.com/

Description of the web application/site
The web application, called the M.A.L.E.N.A.H. Portal, is constructed on the Google App Engine cloud service/platform in Python.

MALENAH stands for **M**obile **A**lly for **L**GBT people, **E**nhancing, through a **N**etwork, **A**ccess to **H**ealthcare. LGBT people face barriers to healthcare access and have a host of unique health-related needs. As such, the web application/site http://malenah-portal.appspot.com serves as an administrator portal, storing information about caring and culturally competent healthcare providers who are equipped to care for LGBT people in the hopes of closing the LGBT health disparities gap.

The MALENAH portal stores information about healthcare providers. Healthcare providers (class Provider) are stored as NDB models (entities) in the NDB datastore, including physicians, dentists, pharmacists, nurses, counsellors, and others. Providers have the following properties:

Attribute of the Provider class (NDB Model)	NDB Property type [1]	Description	Form input
first_name	ndb.StringProperty()	Healthcare provider's first name	<input type="text">
last_name	ndb.StringProperty()	Healthcare provider's last name	<input type="text">
phone	ndb.StringProperty()	Healthcare provider's phone number	<input type="tel">
email	ndb.StringProperty()	Healthcare provider's email address	<input type="email">
website	ndb.StringProperty()	Healthcare provider's website url	<input type="url">
best_time	ndb.TimeProperty()	Best time to contact the healthcare provider	<input type="time">
designation	ndb.StringProperty()	The healthcare provider's designation/degree (e.g. MD, RN, Pharm.D)	<input type="radio">
service(s)	ndb.KeyProperty (repeated=True)	Service(s) offered by the healthcare provider	<input type="checkbox">
accept_new_patients	ndb.BooleanProperty()	Whether or not the healthcare provider is accepting new patients	<input type="radio">

- The datastore also stores two additional NDB models as entities: healthcare services and healthcare professional designations, both of which have a name as a StringProperty() and are associated with healthcare providers.

Attribute of the Designation class (NDB Model)	NDB Property type [1]	Description	Form input
name	ndb.StringProperty()	Name of the designation associated with a healthcare provider	<input type="text">

Attribute of the Service class (NDB Model)	NDB Property type [1]	Description	Form input
name	ndb.StringProperty()	Name of the service provided a healthcare provider	<input type="text">

Test Plan

To ensure that the web application is working properly, I used this test plan, containing 31 manual tests.

#	Type	Test Case	Input	Expected Outcome	Observed Outcome
1	Blank	Empty database. Attempt to submit the "Add Provider" form with empty fields in Google Chrome, Firefox.	Click on the submit button in the "Add Healthcare Provider" form.	HTML5 form should prompt the user to complete the required fields before form can be submitted.	As expected, the healthcare provider form does not allow submission without required fields completed.
2	Edge case	Empty database. Attempt to submit the "Add Provider" form with empty fields in Safari, where support for the "required" tag is only partial [1].	Click on the submit button in the "Add Healthcare Provider" form.	HTML5 form should prompt the user to complete the required fields before form can be submitted.	The following error messages appear, as expected: *Form Submission is Unsuccessful for the following reason(s): You did not enter a first name. You did not enter a last name. You did not enter a phone number. You did not enter an email. You did not enter a website. You did not enter a contact time. You did not enter whether or not new patients are being accepted.*
3	Blank	Submit empty designation	Click on the submit button in the "Add a Designation" form.	HTML5 form should prompt user to complete required field before submitting.	In the Google Chrome browser, the designation form does not allow submission due to the required attribute on the input tag. This is the correct outcome. In the Safari browser, as expected, the form submits but the following error message is displayed to the user: *Unable to add record for the following reason(s): You did not enter a designation to add.* This is also the correct outcome for this browser.
4	Blank	Submit empty service	Click on the submit button in the "Add a Service" form	HTML5 form should prompt user to complete required field before submitting.	In the Google Chrome browser, the designation form does not allow submission due to the required attribute on the input tag. This is the correct outcome. In the Safari browser, as expected, the form submits but the following error message is displayed to the user*: Unable to add record for the following reason(s): You did not enter a service to add.* This is also the correct outcome for this browser.
5	Edge	Empty database, create first (non-empty) service	Enter "Counselling" into the "Add a Service" form	Counselling service added successfully (as shown in the /view page) and appears as a radio button choice in the "Add Provider" form on form submission. No records in the Provider or Designation tables	Service is recorded as expected **Record added** You added the following record (Service): Service: Lab Services Back to Home Service now appears in the provider form
6	Edge	Empty database, create first designation	Enter "Pharm.D" into the "Add a Designation" form	Pharm.D designation service added successfully (as indicated in the /view page) and appears as a checkbox in the "Add Provider" form. No records in the Provider or Designation tables	Designation recorded as expected **You added the following record (Designation):** Designation: RN Back to Home Designation appears in the provider form as expected.
7	Edge Blank	Empty database, create first provider without first creating a service or a designation	first name: Kelvin last name: Watson phone: 9716786247 email: abc@abc.com website: http://abc.com best time to contact: 11:59pm designation: services: accepting patients: No	Provider successfully added as evidenced by the /view page Provider appears in Provider table on form submission, with empty cells under the Designation and Services columns.	Record successfully added as expected. **Record added** You added the following record (Healthcare Pr

| #	Type	Description	Input	Expected Result	Actual Result
8	Edge Blank	Empty database, create first provider without first creating a service but having created a designation	first name: Kelvin last name: Watson phone: 9716786247 email: abc@abc.com website: http://abc.com best time to contact: 11:59pm designation: services: Counselling accepting patients: Yes	Provider successfully added as evidenced by the /view page	Provider is successfully added and does not show any associated designations, as expected. **Record added** You added the following record (Healt First Name: Kelvin Last Name: Watson Phone: 9716786247 Email: abc@abc.com Website: http://abc.com Best Time to Contact You: 23:59 Designation: Services: • Counselling Accepting Patients: Yes Back to Home
9	Edge Blank	Empty database, create first provider without first creating a designation but having created a service	first name: Kelvin last name: Watson phone: 9716786247 email: abc@abc.com website: http://abc.com best time to contact: 10:59AM designation: B.Sc services: accepting patients: No	Provider successfully added as evidenced by the /view page Provider appears in Provider table on form submission, with empty cell under the Services columns, but the "B.Sc" designation under the Designation column. B.Sc should also be in the Designations table beneath the Provider table in the view and admin pages.	Record is added as expected. **Record added** You added the following record (Healthcare P First Name: Kelvin Last Name: Watson Phone: 1234567890 Email: kelvincswatson@gmail.com Website: http://abc.com Best Time to Contact You: 10:59 Designation: B.Sc Services: Accepting Patients: No Back to Home Designations **Designation Types** B.Sc
10	Edge	Delete all services, even though they have been associated with providers	Delete all services using the Datastore Admin and refresh the /admin page	"All Records Currently in Database" provider table should still render the previously added services.	Under "All Records Currently in Database," Designation table is empty, but provider tables still contain designations. This is the desired outcome. Services Ac P No • Counselling Ye No • Diabetes Education • Nutrition • Weight Management No
11	Edge	Navigate to the /view page directly.	malenah-portal.appspot.com/view	Redirects to /admin	Redirects to /admin as expected.
12	Edge	Navigate to the /edit page directly	malenah-portal.appspot.com/edit	Redirects to /admin	Redirects to /admin as expected.
13	Edge	Navigate to an invalid url e.g. malenah-portal.appspot.com/a!	malenah-portal.appspot.com/a!	Redirects to /admin page	Redirects to /admin as expected.
14	Edge	Navigate to the /admin page directly.	malenah-portal.appspot.com/admin	Correctly renders administration page with forms	Correctly renders administration page with forms
15	Basic	Duplicate designation	Add designation "MD" twice	Reject the addition of designations with the same name as a designation entity already in the database.	Unable to add record for the following reason(s): The designation you are trying to add already exists in the database.
16	Basic	Duplicate service	Add service "Counseling" twice	Reject the addition of services with the same name as a service entity already in the database.	Unable to add record for the following reason(s): The service you are trying to add already exists in the database.
17	Basic	Enter invalid URL for website	Enter "abc.abc" in the website field of the provider form.	Should reject invalid URLs, such as those with incorrect or missing protocols and/or top-level domains	The website field expects either http:// or https:// in the field and invalid inputs such as "abc.abc" are correctly rejected. abc.abc Best time of day to contact you 09:15 AM ! Please enter a URL. However, as long as the protocol is provided, an invalid URL is still accepted. This is not a desired outcome. Website: http://abc
18	Basic	Enter invalid phone number	'abc-def-ghij'	Application should reject invalid phone numbers.	The application accepted an invalid phone number (a string containing non-numeric characters). This is not the desired result.

3 2	Basic	Edit whether or not provider is accepting patients in a provider that did not accept patients	Click on "Edit" next to the provider. Edit the response to "Yes" under "Accepting Patients," then click on the "Update Record" button.	If the provider's did not originally accept patients, the "No" radio button should be checked off in the edit page. Checking off "Yes" should correctly edit the record.	In the edit form, the "No" next to Accepting Patients is correctly checked off. Checking off the record to "Yes" under "Accepting Patients" correctly changes the record.

Results of Executing Test Plan

The process of documenting the test plan initially revealed a number of bugs, most of which have now been fixed. These bugs were mostly due to inadequate error checking, and including the following:

Bugs	Explanation of Fixes
Duplicate entries of designations and services did not get caught	FIXED On an attempt to insert a designation or service entity into the database, a check is performed by retrieving all designations or services and comparing the names of all queried entities with that of the user's input. If an entity is identified with the same name as the name entered on user input, the database insertion is rejected.
Routing bug - navigating directly to /view or /edit does not automatically redirect to the /admin page	FIXED By fixing the app.yaml routing url's and fixing the order of the handlers in main.py, direct navigation to /view, /edit, or /(any character(s)) will result in redirection to /admin so that the AdminHandler can render the admin page.
Routing bug – handlers placed in the wrong order resulting in the admin page always being rendered instead of the edit page.	FIXED The default route '.*' should be the listed last as the application tries to match the routes in order. [5]
Missing input validation for empty form input fields. Safari allows forms to be posted/submitted even when input fields containing the "required" attribute are left empty	FIXED If the Safari browser is used, empty form fields are now detected and a corresponding error message is displayed. In the Chrome browser, the "required" attribute of the input tags correctly detect empty form fields.
Missing return statement in post and get methods when form input invalid	FIXED Adding a return statement in the post and get methods when form input is invalid correctly prevents additional calls to get and post on error.

Explanation of Failures
There are several outstanding bugs, which include the following:
1. The application currently does not parse URL's, and accepts invalid URL's with missing top-level domains and stores them in the database as strings.
 - In order to fix this bug, I could use regular expressions. An easier way would need to import a library such as the validator library, urlparse from urlparse, or the URLValidator from django.core.validators in Python to parse URL's. [6] [7]
2. The application currently does not parse phone numbers. Instead, it accepts invalid phone numbers and stores them in the database as strings..
 - In order to fix this bug, I would need to import a library such as phonenumbers 7.2.3 in Python to parse phone numbers. [8]
3. The application currently does not parse email addresses, and accepts invalid email addresses and stores them in the database as strings.
 - In order to fix this bug, I would need to import a library such as validate_email 1.3 in Python to parse phone numbers. The Python validators library is also able to validate emails. [6] [9]

Discussion of Templating to Display Data
Specifically, using Jinja templating to implement logic, render variables, access properties. For logic, I used the following control structures: the *for* loop, the *if/elif/else* statements. I also used Jinja for comparison of strings for equality, for example, {% if s.name == t.name %} compares two strings.

By using the *extends* tag, I was able to extend an html template called index.html to all of my other page templates. For instance, in my admin.html template, I used the statement {% include index.html' %} to prevent the need to duplicate html tags and jinja expressions common among the pages, such as <html>, <head>, <title> <body> or {{title}}.

Using the *extends* tag also allowed me to override blocks within the index.html template as necessary. For instance, index.html contains a content *block* {% block content %} as well as an "all database data" block {% block all_database_data %}. Only the admin and view pages override the all_database_data block. All pages override the content block.

Finally, I used filters to pipe expressions into Jinja's built-in filters, including *length()* to get the number of items in a list, and *string()* to convert a string to Unicode.

Changes I would make if I had to do it over again
I would design my application more thoroughly prior to coding to reduce the amount of code duplication. For instance, the get() and post() methods in the view.py ViewHandler contains many lines of code in common. This indicates that incorporating an appropriate object-oriented design pattern could have resulted in much cleaner code.

Some features that I missed were text validation, including stripping of leading and trailing white space. In addition, there should be stricter input validation of phone numbers <input type="tel"> and emails <input type="email"> records as explained in the outstanding bugs in the application. Importing of additional libraries to valid emails, phone numbers and website URL's can sufficiently address these issues.

Thinking ahead to the mobile application portion of the course, if I had to do this assignment over again, I would have made the code more adaptable/flexible to creating a sort of backend API to respond to requests from a mobile application.
